

## **List of Environmentally Relevant Substances – Directive 2002/95/EC (RoHS)**

WIMA do not only develop new products and manufacturing procedures, but also endeavour to use environmentally friendly products, processes and packaging material.

WIMA capacitors are produced on ultra-modern production lines which fulfil today's standards of environmental needs as far as energy and raw material consumption and usage of specific manufacturing processes are concerned.

When choosing substances severe criteria of environmental protection are applied and all relevant specifications and test regulations for capacitors are taken into account.

Based on the state-of-the-art analyses technology and on our suppliers' information, we are in a position to confirm that WIMA capacitors and their production processes are free of environmentally harmful substances e.g.

Lead  
Cadmium  
Mercury  
Chromium-VI  
and Brominated Flame Retardants

or their low concentration does not require verification respectively, and thus are not subjected to the lists of banned and totally-abolished substances. This refers to the entire WIMA component range.
